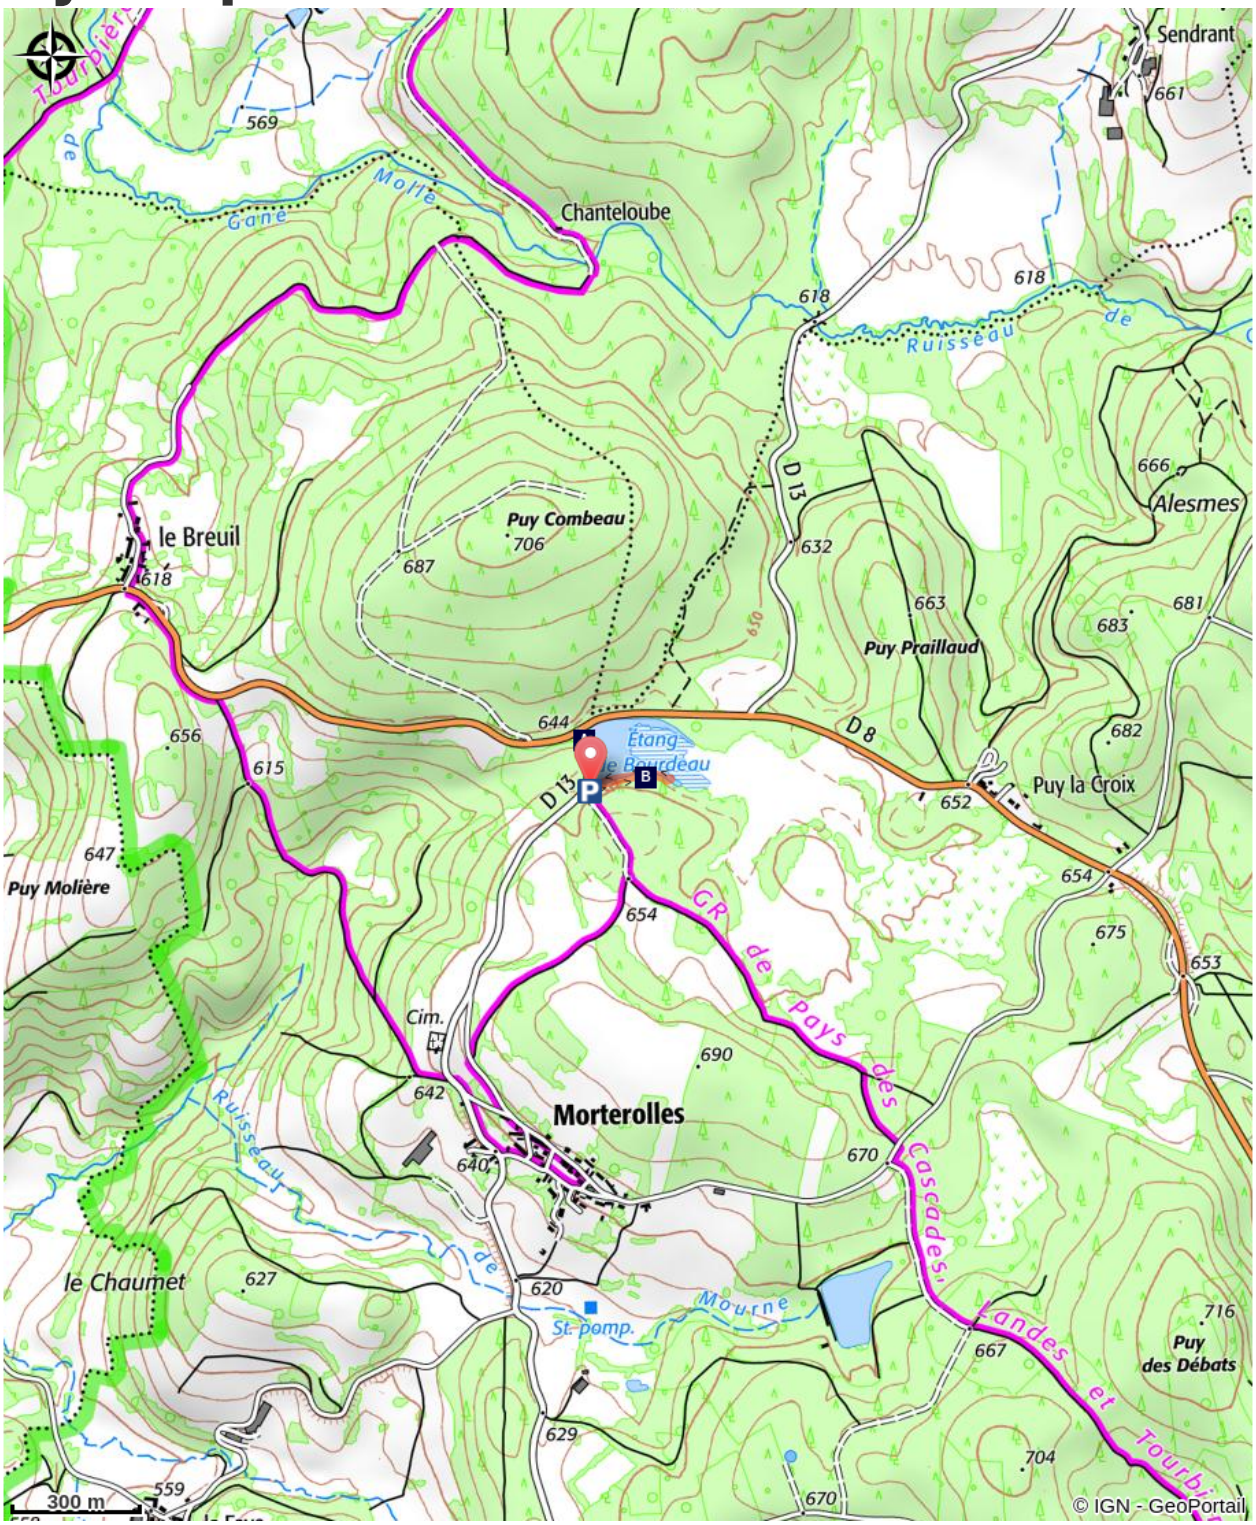
On your path...



Peatland Insects (A)

Recent inventories have shown that this site is particularly rich in insects (beetles and dragonflies in particular). Rare species such as the Northern Emerald dragonfly and the Dainty damselfly are present.

Andromeda polifolia, the bog rosemary (B)

This small shrub lives only in acidic peat bogs with sphagnum moss up to 1500 m altitude. Present only in three sectors in Limousin, it is rare and protected. The numerous stands present on this site make it an exceptional place to see the plant. Its pink bells appear towards the end of spring.
